Expression backend scaling through the full datasets

Both axes are logarithmic. Rings and dashed extensions: existing Full dataset measurements; no reruns.
Points: median across 5 builds; whiskers: min-max, not confidence intervals. Access: median of 2 processes per build.
Same query strategy at every tier; selected genes vary with tier. Lines join observations, not fitted scaling laws.
Embedded: Human 500k skipped for memory; 1m and full not scheduled in either dataset. RSS is after load, not build peak.
